Nordic Commons for Health Data

Challenges and opportunities

NordForsk Programmes involving Nordic registers and biobanks

The Norwegian Presidency Project 2017: "Norden i omstilling"
Ministry of Health and Care Services, Norway

Nordic Council of Ministers EK-S →

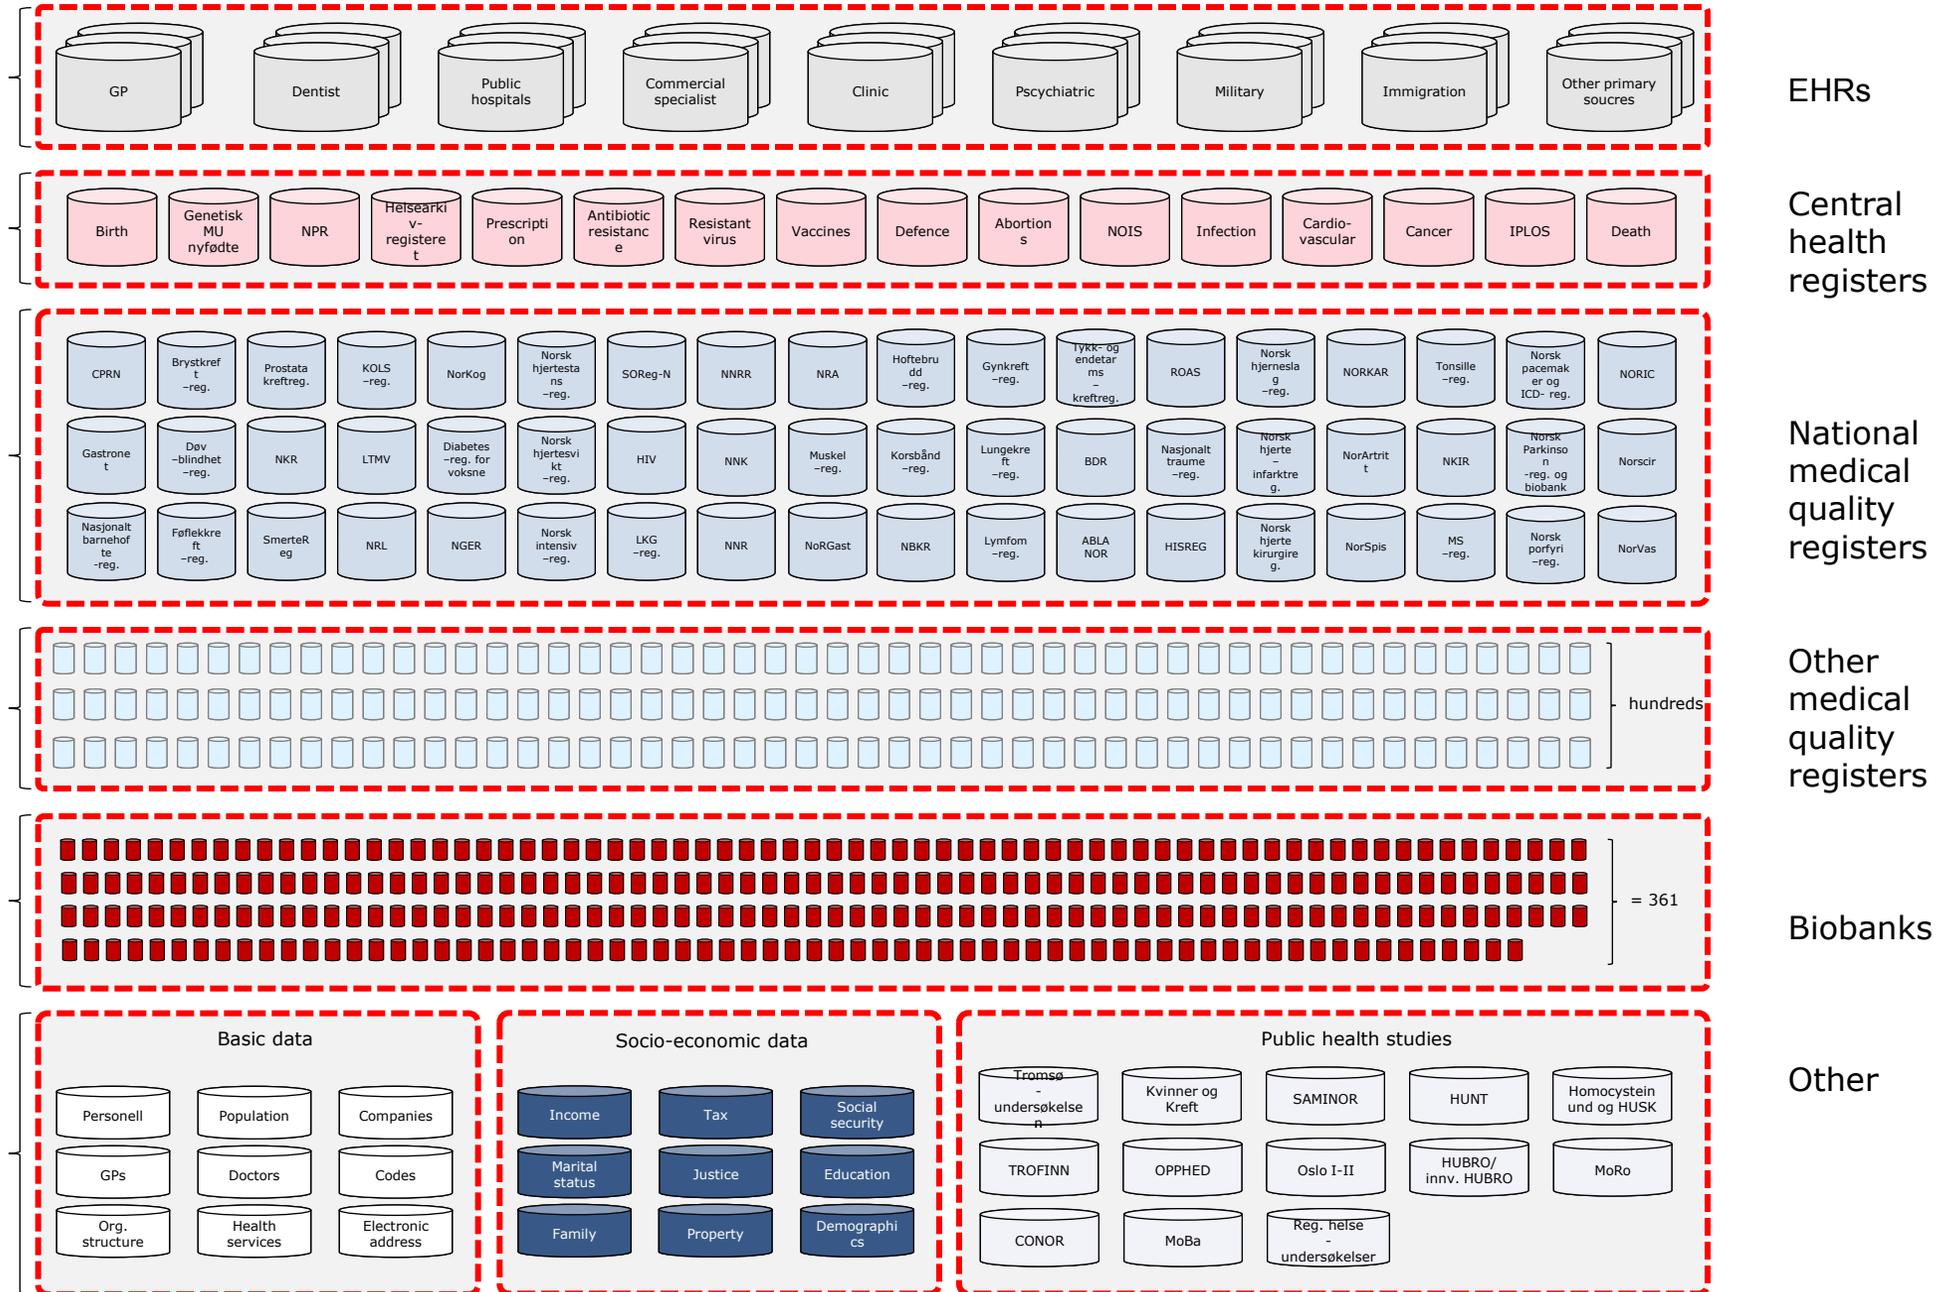

NordForsk Programme for Health and Welfare

Nordic registers and biobanks – A goldmine for research

- The Nordic countries have a unique knowledge resource in its **longitudinal** disease and population registers
- The **Personal Identification Number (PIN)** allows linkage to biobanks and other databases
- Nordic data allows **comparisons** between countries or **joint analysis** at the Nordic level
- Population of 27 million - analysis at Nordic level will increase the possibility to find associations for **rare diagnoses and events**
- Could be used to find solutions to societal and public health challenges, evidence-based decisions, as well as to follow up political incentives

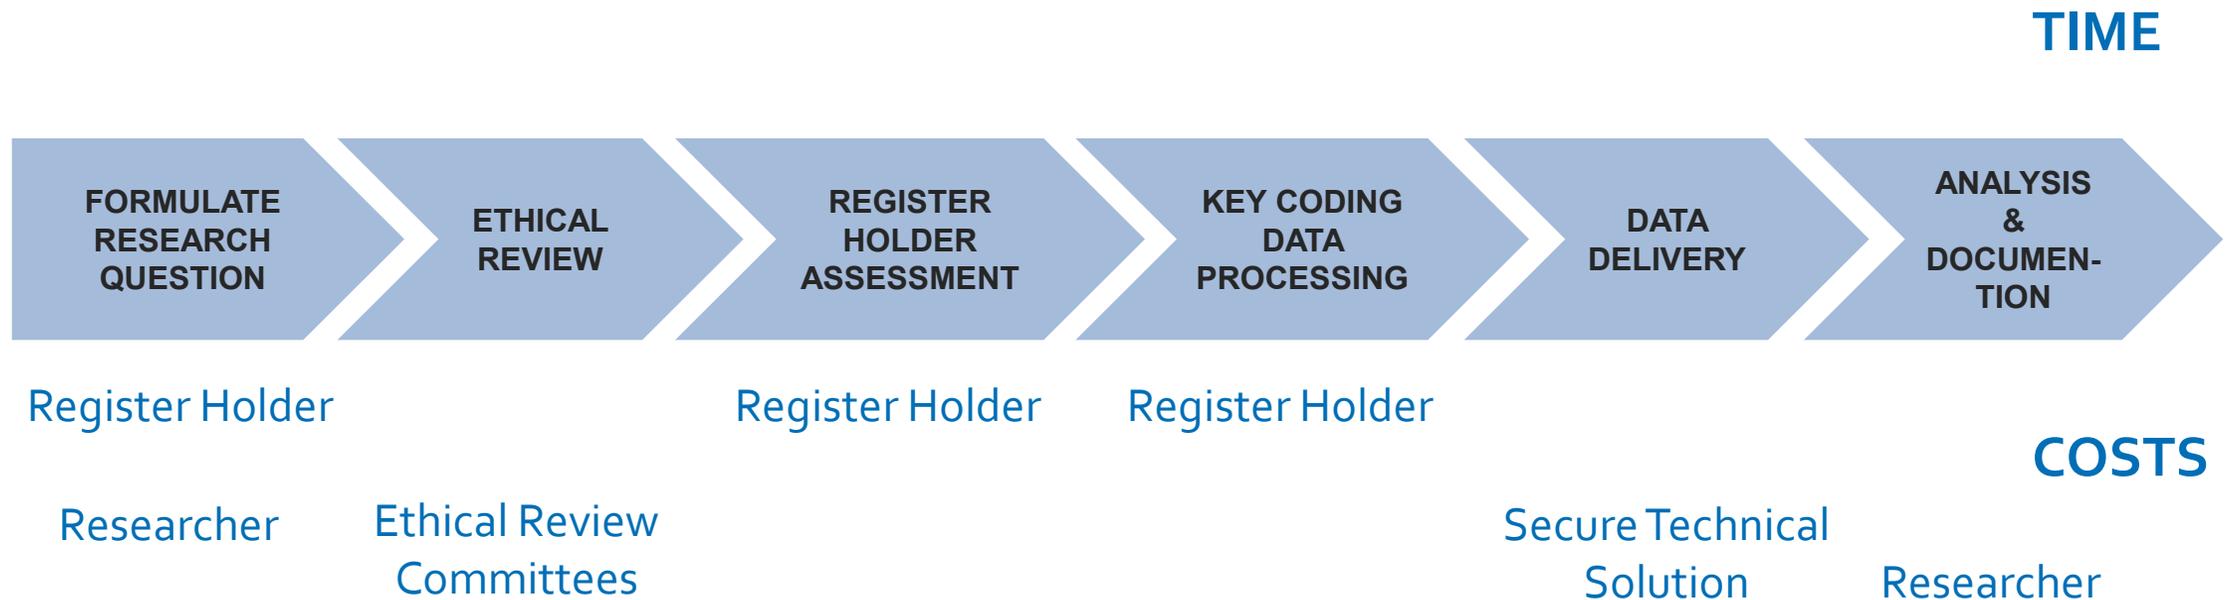

Broad scope: Health data sources in Norway

From eHelsedir.

The data retrieval process: key steps and actors

- The process is similar in the Nordic countries
- The time and costs vary - increase with a Nordic study

FORMULATE RESEARCH
QUESTION

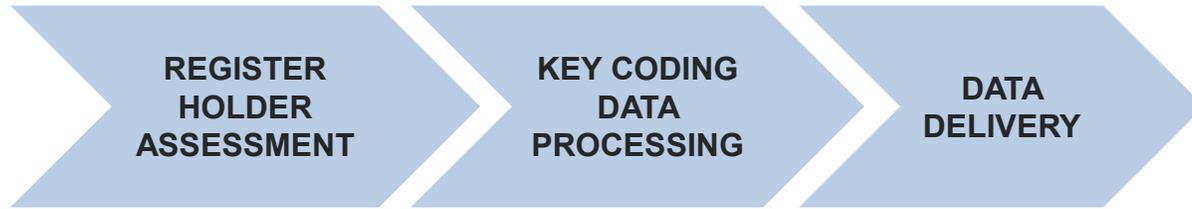

ETHICAL
REVIEW

Challenge: Lack of information

- What data exist? In which registers? Meaning?
- Can data in different registers be linked?
- How do I request data? Do I need any specific permissions?
- What legislation is applicable?

- **Limited knowledge of what permits are needed and what procedures are in place, even among researchers in the field**
- **Long and time-consuming dialogues with the register holders**
- **Need to apply for ethical permissions and data in each individual country**

Challenge: Logistics

- Lack of coordinated processes between register holders both within countries and between Nordic countries
- Each national Statistics Agency inclined to lock-up their data at their own facility
- Need for secure technical environments for joint analysis

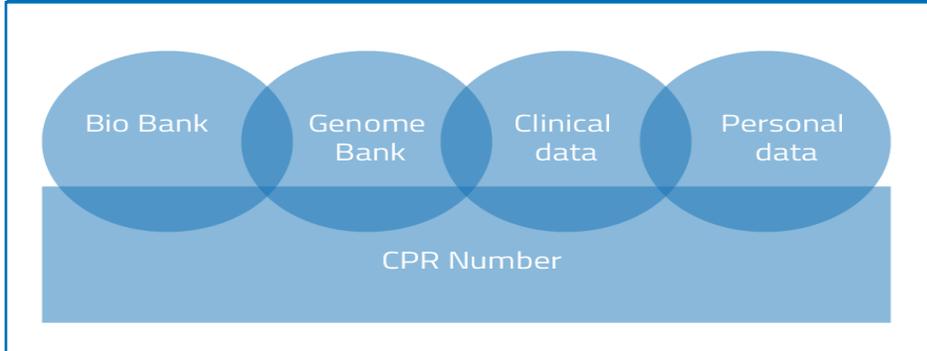

- **The researcher is dependent on a good dialogue between the register holders**
- **The researcher often needs to facilitate the process**
- **The register holders need to trust each other's technical platforms**

National programs for Integrated Health Data

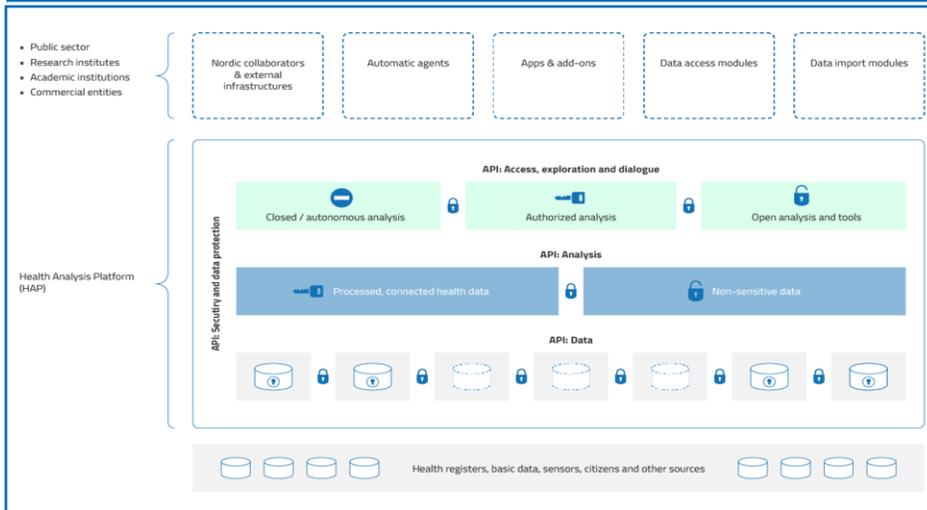

National organizational, legal, financial and ethical perspective

Focus on research, health care and industry

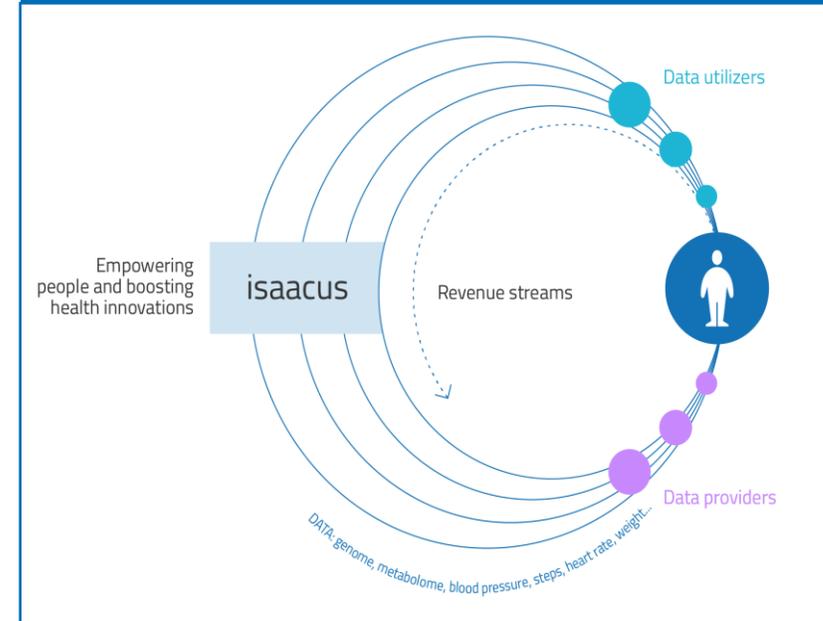

Denmark - Unique position with Integrated Health Data

Norway - The Norwegian Health Data Program is working on concepts for a national health analysis platform

Finland - Isaacus programme

Sweden – No specific national health data program

To date, there is no specific national health data program for Sweden. The landscape is rather fragmented.

Vetenskapsrådet has a **Register Infrastructure Programme** with a **RUT** data interface. Vinnova has a strategic innovation program **SweLife** and a recent initiative **Genomic Medicine Sweden**.

Nordic Commons - vision

“A shared virtual space where scientists can work with the digital objects of **biomedical** research.

This is a system that will allow investigators to find, manage, share, use and reuse data, software, metadata and workflows”.

Components of a Commons eco-system

- ❑ **A computing environment**, such as the cloud and/or HPC (High Performance Computing) resources, which support access, utilization and storage of digital objects.
- ❑ **Data & metadata sets** that adhere to a set of Digital Object Compliance Principles which describe the properties of digital objects that enables them to be **findable, accessible, interoperable and reusable (FAIR)**.
- ❑ **Software services and tools that enable;**
 - Scalable provisioning of compute resources.
 - Interoperability between digital objects within the Commons.
 - Indexing and thus discoverability of digital objects.
 - Sharing of digital objects between individuals or groups.
 - Access to and deployment of scientific analysis tools and pipeline workflows.
 - Connectivity with other repositories, registries and resources that support scholarly research.

Towards a Nordic Commons for Health Data

- Nordic working groups on
 - **TECHNICAL SOLUTIONS:** Synchronizing national e-infrastructures for secure federated storage, sharing and analyses of sensitive personal data
 - **METADATA:** Focus on how to describe Nordic health data according to the FAIR* principles
 - **LEGAL FRAMEWORK:** Focus on legal questions related to technical solutions in 1.

INTERIM REPORT TO BE SENT OUT FOR FACTUAL CHECKS JAN 2019

FINAL REPORT TO BE PRESENTED TO EK-S SPRING/MID 2019

* Data being Findable-Accessible-Interoperable-Re-usable (**FAIR**)

Technical solutions

A Nordic secure orchestrator

Working group

- Peter Løngreen, Danish Technical University DTU, DK (Chair)
- Ali Syed, Danish Technical University DTU, DK
- Antti Pursula, Nordic e-Infrastructure Cooperation, FI
- Tommi Nyrönen, CSC, Elixir Finland, FI
- Hanne Cecilie Otterdal, Helsedataplattformen, NO
- Maria Francesca Lozzi, SIGMA2, NO
- Ann-Charlotte Sonnhammer, SNIC Uppsala University, SE
- Hanifeh Khayerri, Swedish Research Council, SE

Current status

National e-Infrastructures for Sensitive Personal Data

Denmark Computerome

DeiC - National Life Science Supercomputer: [Computerome](#) is the National dedicated e-infrastructure for health care and life sciences. It supports 1600 users locally and on European scene through its involvement in the [ELIXIR](#) and initiatives NeIC Tryggve. It provides a secure cloud service.

Finland CSC ePouta

CSC ePouta is a Finnish cloud computing environment delivered as IaaS (*Infrastructure as a Service*) designed for processing sensitive data. The ePouta cloud is being routinely used by several user groups, including national Center of Excellence for Tumor Genetics and Finnish Institute for Molecular Medicine.

Norway TSD

The project Services for Sensitive Data (TSD), initiated by USIT (The University Centre of Information Technology) at The University of Oslo, is a national service to researchers in Norway and abroad for storing and processing sensitive data, including health data. TSD provides a secure cloud service in production environment.

Sweden Bianca, Mosler, RUT and MONA

Currently no unified national cloud solution for health and welfare, but several actors are involved offering their own local solutions to health and welfare data producers and users. However, the e-infrastructures for sensitive *research data* are in the forefront and are best qualified to be considered national cloud solutions. These would be the:

Bianca system on the Swedish National Infrastructure for Computing

Swedish ELIXIR system Mosler

Swedish Registry Utilizer Tool being built (RUT)

Statistics Sweden's Microdata Online system (MONA)

Collaboration through the Tryggve/Tryggve2 (2014-2020) projects for sensitive data hosted by the Nordic eInfrastructure Collaboration NeIC

NORDIC TECHNICAL SOLUTION BUILDS ON EXISTING COMPONENTS

INTEGRATION

patient, clinical, register,
research data

COMPUTE POWER

Controlled access and
computability of data

SECURE STORAGE

Long term storage of
sensitive data: Genomic
and other health
related data

SECURE ACCES

Prevent abuse of data
by introducing the highest
level of security of both data
and connections

APPS AND SERVICES

Easy to use front-end apps
and interfaces for clinical
use of precision medicine

Example flow

Federated solution – Orchestrator governs joint space

Automated log – a Nordic Log Store

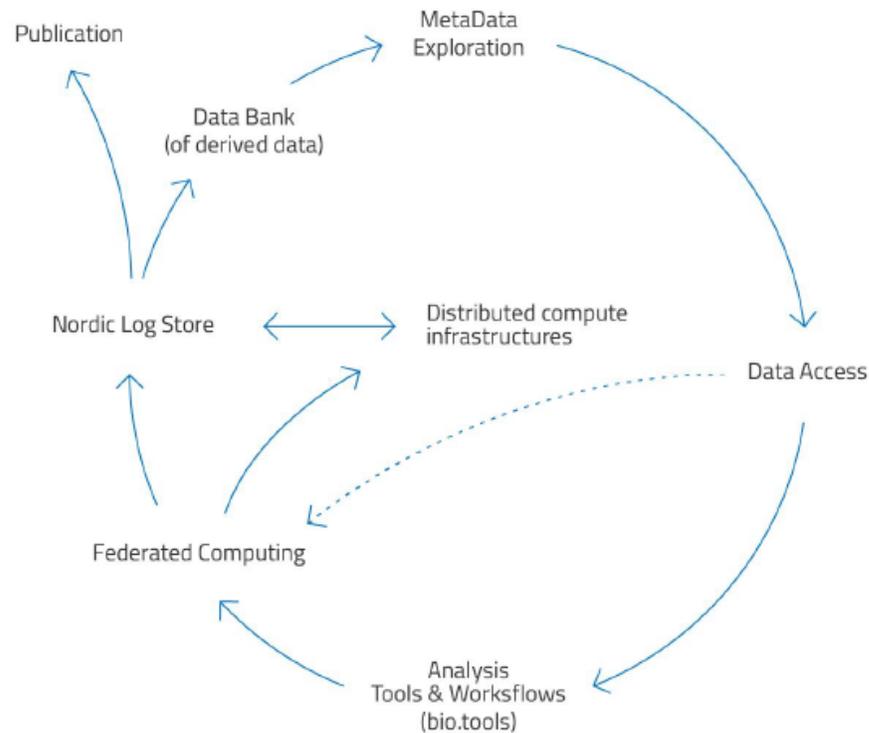

Fig: Life cycle of data in a project running within the Nordic Secure Cloud

- The Orchestrator distributes the tasks to the available data centers.
- All operations are logged in a Nordic Log Store.
- The derived data are assigned an identifier (e.g. DOI).
- Metadata of the analysis process feeds into the original metadata repositories.
- The loop is closed!

Nordic health metadata

Working group

- Magnus Eriksson, Swedish Research Council, SE (Chair)
- Jeppe Klok Due, Det koordinerende organ
för registerforskning, KOR, DK
- Arto Vuori, National Institute for Health and Welfare, FI
- Truls Korsgaard, Directorate for e-Health, NO

Describe data

Findable

Good descriptions of the data we want to find, relevant attributes on appropriate levels

- "Rich metadata"

Accessible from a solution providing search functionality

- "Indexed in a Searchable resource"

Be able to handle same names on datasets, variables, researchers, publications...etc without mixing them up.

- "Persistent identifier"

Accessible

So we can evaluate and find it again, reuse it in different contexts when appropriate.

- "Metadata are accessible, even when the data are no longer available."

Easy to access the metadata using software.

- "(meta)data are retrievable by their identifier using a standardized communications protocol."

For those who have permissions

- "the protocol allows for an authentication and authorization"

Without needing to use vendor specific software or solutions in order to be able to access

- "the protocol is open, free, and universally implementable."

Describe data

Interoperable

The meaning of the data are described in a way that provides context and make it understandable not only by people but also computers.

- "(meta)data use a formal, accessible, shared, and broadly applicable language for knowledge representation"

The semantics (concepts and concept systems) are described with references to terminologies, ontologies etc.

- "(meta)data use vocabularies that follow FAIR principles."

Reusable

Detailed descriptions of the data content we want to reuse by relevant attributes

- "meta(data) have a plurality of accurate and relevant attributes."

Making sure we know in what way we are allowed to use it.

- "(meta)data are released with a clear and accessible data usage license."

And with detailed descriptions of how it has been produced, from which sources, by whom using what resources.

- "(meta)data are associated with their provenance."

In a way that it can be easily used with tools and in combination with other data from the domain.

- "(meta)data meet domain-relevant community standards."

Levels of detail: Metadata & Semantics

Descriptions of	Content	Examples	Ex. Standards
Framework standards	How to describe data and concepts used for descriptions	Concept, ConceptSystem, Variable, Population, Dataset...	ISO11179, GSIM
Dataset level standards	Attributes to describe the dataset.	Creator, Title, Publisher, Publication year, ResourceType, Funding... (DataCite)	DataCite DDI DCAT-AP ...
Domain specific standards	What should be described and details on how.	Patient (resource, domain, unittype...) <ul style="list-style-type: none"> • Birth time (attribute, variable...) • Nationality Organisation <ul style="list-style-type: none"> • Alias • Period... Medication (HL7 FHIR)	HL7 FHIR HL7 V3 DDI OMOP
Related standards			
Semantics	Concepts and terms to define meaning and context for humans and computers.	Läkemedel <ul style="list-style-type: none"> • "SCTID: 410942007, Läkemedel" (SnomedCT) • "Läkemedel för humant eller veterinärt bruk, i sin bruksfärdiga form. Hit räknas också de ämnen som används i framställningen av den färdiga preparatformen." (Mesh) 	SnomedCT Mesh Loinc Nationellt fackspråk
Persistent Identifiers	Unique keys for metadata and data resources.	Persistent Identifiers for researchers, Data Sets...	DOI ORCHID

Legal Framework

Working group:

- Marjut Salokannel, FI
- Victoria Söderqvist, SE
- Manolis Nymark, SE
- Ragnhild Angell Holst, NO
- Lars Emde Poulsen, DK

3. Legal Framework

- Ensure accreditation of compute facilities
- Ensure Nordic alignment of national safeguards in the wake of GDPR
- Anchor the Nordic solution with national data protection authorities
- Ensure certification and set up a code of conduct for the Nordic solution

Thank you for your attention!
